Lablup & Furiosa AI Track

01 · WHO WE BUILD FOR

THE AI PLATFORM ENGINEER WHO CANNOT SEND PRIVATE CODE OUTSIDE.

Our beachhead user

Enterprise AI Platform Engineer

Builds coding and research agents over internal Git repositories, technical documents, API docs, and business data.

THE DAILY QUESTION

Qwen3-32B

GPT-OSS-120B

K-EXAONE-236B

Which model should run which workload - and how many calls are actually necessary?

Local AI gives control. Orchestration decides whether that control is usable.

02 · THE PROBLEM

MORE AGENTS DID NOT MEAN BETTER INTELLIGENCE.

943

model requests

6.41

calls / item

3.33M

tokens

0.209

score

One coding task was repeatedly decomposed into design, implementation, verification, and edge-case tasks. The same solver reasoned again and again.

If an extra agent creates no new information, it adds cost, latency, and output risk.

03 · THE ARCHITECTURE

WE REMOVED THE HANDOFFS.

Squad-8 = one planner + one universal solver

Removed Reasoner · Reviewer · Finalizer

Track differences live in the output contract, not in the agent topology.

04 · MODEL ROLE MAPPING

USE THE STRONG MODEL ONLY WHERE STRENGTH MATTERS.

QWEN3-32B**Planner**

40K context

Short, conservative task creation

GPT-OSS-120B**Universal Solver**

128K context

Coding + math + general reasoning

K-EXAONE-236B**Conditional specialist**

48K · 4-bit

Only after workload validation

The product decides which model, when, how many calls, and whether a workload is proven enough to deserve a specialist.

05 · THE PRODUCT

THE EXECUTION SHOULD BE VISIBLE, NOT BURIED IN LOGS.

3D AGENT FLOW

dependency + execution order

LIVE STATE

thinking → done

RESULT + PATH

answer with provenance

FOLLOW-UP

continue from current context

Developers do not just see the answer. They see how the answer was made.

06 · WHY IT MATTERS

LOCAL MODELS ARE NOT THE PRODUCT. CONTROL IS.

- Route** the right local model
- Observe** the actual agent execution
- Optimize** accuracy, latency, and cost
